SutureClose™
Laparoscopic Port Closure System

- Technology for fascia/peritoneum closure
- Ability to close multiple sites during same procedure
- Closure under visualization
- Mitigates the possibility of port site hernias
- Closure without having to extend the incision
- One handed operation
- Sterile and single use device

The DeRoyal® SutureClose™ aids in closing incisions and offers a spring-loaded grasper to help guide the suture when closing the site. With a push of a button, the grasper is engaged and is ready to accept the suture. Once the suture is firmly grasped, and the button is disengaged, the suture retracts into the needle shaft. Simply insert the needle into the peritoneum and release the suture using the needle guide. Reverse the angle of the grasper and retrieve the suture for closure of the incision site.

**Step 1**
- Insert the needle introducer with the holes aligned vertical to the trocar wound. Depress the top button to expose the jaws inside the stylet and load the suture. Puncture the needle through fascia, muscle, and peritoneum into the abdomen. Drop the suture and remove the OmniClose needle.

**Step 2**
- Do not depress the button during insertion of Unimax OmniClose trocar site closure device; to do so may prevent the needle tip from penetrating tissue.

**Step 3**
- Do not use Unimax OmniClose trocar site closure device where is not possible to visualize the tip of the incision site.

**Step 4**
- After removing Unimax OmniClose trocar site closure device from the abdominal cavity, always inspect the site for hemostasis.
