

Arm Sling

Single Patient Use Only

IMPORTANT INFORMATION

Please read carefully and completely before applying.

INTENDED USE

The arm sling is designed to fit the majority of patients. Most arm slings are designed especially for patients with sprains, strains and/or casts. They are available with buckle or hook and loop closure and in a variety of materials. The purpose of an arm sling is to disperse the weight of the forearm (and cast) to the back and shoulder.

There are many styles and sizes of arm slings available through DeRoyal. Contact your DeRoyal sales representative for more information.

PRECAUTIONS

Consult your medical professional immediately if you experience sensation changes, unusual reactions, swelling or prolonged pain while using this product.

Arm Sling Fitting Tip: If the arm sling is fitted properly, the end should extend to the first joint on the little finger (the P.I.P. Joint). The arm sling should also be slightly elevated to help prevent edema.

INSTRUCTIONS FOR USE

1. Attach shoulder pad by inserting strap through openings (when available).
2. Place affected arm in sling so that the arm rests in the fold of the sling. (2a) Depending on sling style, place thumb in thumb loop to prevent wrist drop. (2b)
3. Bring strap over opposite shoulder.
 - a. If sling has hook and loop closure, bring strap through the double D-rings and secure hook to loop sewn on strap.
 - b. If sling has buckle closure, bring strap through buckle and adjust to proper height.
4. When applicable, use sliding buckle in back to adjust for proper sling height.
5. Make sure sling supports arm securely.
